Bibliography / links

Physics of atoms and molecules (1983) : Brian Harold Bransden and Charles Jean Joachain

Molecular Quantum Mechanics (4th Ed 2005) : Peter Atkins

Astronomical Spectroscopy: An Introduction To The Atomic And Molecular Physics Of Astronomical Spectra (2005):Jonathan Tennyson

Quantum chemistry (2008): Donald A. Mc Quarrie

Contents

Part or chapter 1: Introduction: Atomic Astrophysics and Spectroscopy

1. Chemical and physical properties of elements
2. Electromagnetic spectrum and observatories
3. Particle distributions
4. Quantum statistics
5. Spectroscopy and photometry
6. Spectroscopic notation
7. Units and dimensions

Part or chapter 2: The Hydrogen Atom

1. The hydrogen atom
2. Quantum numbers and parity
3. Spectral lines and the Rydberg formula
4. Spectroscopic designation
5. The ground state of multi-electron systems
6. Empirical rules for electronic configurations
7. Intermediate coupling and $j-j$ coupling
8. Hund's rules
9. Rydberg formula with quantum defect
10. Multi-electron atomic systems
11. The Hartree-Fock method
12. Central-field approximation
13. Relativistic fine structure

Part or chapter 3: The Atomic Process; bound continuum and resonance states

1. Bound, continuum and resonance states
2. Collisional and radiative atomic processes
3. Theoretical approximations
4. The close coupling approximation
5. The R-matrix method
6. Approximate methods

Part or chapter 4: Radiative Transitions

1. Einstein A and B coefficients

2. Electron motion in an electromagnetic field
3. Transition matrix elements
4. Multipole expansion
5. Electric dipole approximation
6. Central-field approximation
7. Length, velocity and acceleration
8. Oscillator strengths for hydrogen
9. Configuration interaction
10. Fine structure
11. R-matrix transition probabilities
12. Higher-order multipole transitions
13. Selection rules and Z -scaling
14. Dipole and non-dipole transitions in He-like ions
15. Angular algebra for radiative transitions

Part or chapter 5: Electron Ion Collisions

1. Electron impact excitation (EIE)
2. Theoretical approximations
3. Excitation rate coefficients
4. Atomic effects
5. Scaling of collision strengths
6. Comparison with experiments
7. Electron impact excitation data
8. Electron impact ionization
9. Auger effect

Part or chapter 6: Photoionisation Hydrogen and Helium

1. Hydrogen and helium
2. Photoionization cross section
3. Bound-free transition matrix element
4. Central potential
5. Generalized bound-free transition probability
6. Channel coupling and resonances
7. Resonance-averaged cross section
8. Radiation damping of resonances
9. Angular distribution and asymmetry

Part or chapter 7: Electron-Ion Recombination

1. Detailed balance
2. Total electron-ion recombination rate
3. Independent treatments for RR and DR
4. The unified treatment
5. Photorecombination and dielectronic recombination
6. Dielectronic satellite lines
7. Recombination to H and H-like ions
8. Ionization equilibrium
9. Effective recombination rate coefficient
10. Plasma effects

Part or chapter 8: Multi-wavelength emission spectra : Emission line analysis

1. Emission line analysis
2. Collisional-radiative model
3. Spectral diagnostics: visible lines
4. X-ray lines: the helium isoelectronic sequence
5. Far-infrared lines: the boron isoelectronic sequence

Part or chapter 9: Absorption lines and radiative transfer

1. Optical depth and column density
2. Line broadening
3. Absorption lines
4. Radiative transfer
5. LTE and non-LTE
